Report of the Kew Observatory Committee for the Year ending December 31, 1896.

The operations of The Kew Observatory, in the Old Deer Park, Richmond, Surrey, are controlled by the Kew Observatory Committee, which is constituted as follows:-

Mr. F. Galton, Chairman.

Captain W. de W. Abney, C.B., | Prof. A. W. Rücker. R.E. Prof. W. G. Adams. Captain E. W. Creak, R.N. Prof. G. C. Foster. Prof. J. Perry. The Earl of Rosse, K.P.

Mr. R. H. Scott.

Mr. W. N. Shaw.

Lieutenant-General R. Strachey, C.S.I.

Rear Admiral W. J. L. Wharton,

On February 16 the Committee sustained a severe loss by the death of General J. T. Walker, C.B., who had been a member and constant attendant of the Committee during ten years, and whose valuable assistance was of special importance to them in furthering pendulum experiments made for geodetic purposes.

The vacancy on the Committee thus occasioned was filled by the appointment of Dr. John Perry, Professor of Mechanics and Mathematics in the Royal College of Science, South Kensington.

The work at the Observatory may be considered under the following heads:-

1st. Magnetic observations.

2nd. Meteorological observations.

3rd. Solar observations.

4th. Experimental, in connexion with any of the departments.

5th. Verification of instruments.

6th. Rating of Watches and Marine Chronometers.

7th. Miscellaneoug.

I. MAGNETIC OBSERVATIONS.

The Magnetographs have been in constant operation throughout the year, and the usual determinations of the Scale Values were made in January.

The ordinates of the various photographic curves representing Declination, Horizontal Force, and Vertical Force were then found to be as follows:—

Declinometer: 1 inch = 0° 22'·04. 1 cm. = 0° 8'·7.

Bifilar, January 15, 1896, for 1 inch $\delta H = 0.0280$ foot grain units. , 1 cm. , = 0.00051 C.G.S. units.

Balance, January 16, 1896, for 1 inch $\delta V = 0.0276$ foot grain units. 1, 1 cm. , = 0.00050 C.G.S. units.

The magnetic curves during the past year have been quite free from any very large fluctuations. Some of the principal variations that were recorded took place on the following days:—

January 3—9, 19—20, 30—31; February 1—4, 13—14, 28—29; March 4, 26—28; April 21—25; May 2—3; June 16; September 18; October 9—12; November 7—8; and December 3—4.

The earthquake of December 17 was shown slightly on the Declination curve, but more distinctly on the Horizontal Force curve, though the disturbance on the latter curve only equalled that due to a change of 0.00004 in the Horizontal Force in the C.G.S. units.

The hourly means and diurnal inequality of the magnetic elements for 1896, for the quiet days selected by the Astronomer Royal, will be found in Appendix I.

The mean values at the noons preceding and succeeding the selected quiet days are also given, but these of course are not employed in calculating the daily means or inequalities.

The following are the mean results for the entire year:-

Mean Westerly Declination 17° 10'.8.

Mean Horizontal Force...... 0.18309 C.G.S. units.

Mean Vertical Force 0.43924 C.G.S. units.

Observations of Absolute Declination, Horizontal Intensity, and Inclination have been made weekly, as a rule.

A "Richard" Thermograph has been in constant action in the Magnetograph Room all through the year in order that its readings may be compared with the observed readings of the Thermometer placed under the Vertical Force shade.

As in 1895, a Table of recent values of the Magnetic Elements at the Observatories whose publications are received at Kew was contributed to 'Science Progress,' appearing in the August number. A similar table, but containing more recent data, will be found in Appendix IA to the present Report.

With the consent of the Committee, an analysis of the non-cyclic effects in the Declination, Horizontal Force, and Vertical Force results for the selected "quiet days" of the six years 1890 to 1895 was drawn up and discussed by the Superintendent, and appears as the Report of 'the B. A. Committee for the Comparison and Reduction of Magnetic Observations, Liverpool, 1896.

At the request of Professors von Bezold and Eschenhagen, the Observatory participated in a combined scheme of eye observations of the Declination and Horizontal Force at intervals of five seconds during an hour on each of the four days February 27, 28, and March 12, 13. On the two last occasions use was made of a very delicate declinometer with quartz fibre suspension, specially devised by Professor C. V. Boys, F.R.S., enthusiastic assistance being given by Messrs. Cooper and Sansom, students at the Royal College of Science, South Kensington.

Owing to the erratic behaviour of the limelight employed to illuminate the declinometer mirror, the results were unfortunately less successful than might have been desired.

The Magnetic Instruments have been studied, and a knowledge of their manipulation obtained, by Commanders Smyth and Heming and Lieutenants Monro and Somerville, of the Royal Navy.

Information as to magnetic data or experimental details has been supplied to Professor Rücker, Dr. E. Atkinson, Lieutenant-Colonel Gore (Trigonometrical Survey of India), Captain Lyons, R.E., and Captain Schück, and the two latter gentlemen compared their instruments with the Observatory standards.

Copies of magnetic curves were supplied to Dr. J. A. Fleming, F.R.S., for use in his lecture before the British Association on "The Earth as a Great Magnet."

II. METEOROLOGICAL OBSERVATIONS.

The several self-recording instruments for the continuous registration of Atmospheric Pressure, Temperature of Air and Wet-bulb, Wind (direction and velocity), Bright Sunshine, and Rain, have been maintained in regular operation throughout the year, and the standard eye observations for the control of the automatic records duly registered.

The tabulations of the meteorological traces have been regularly made, and these, as well as copies of the eye observations, with

notes of weather, cloud, and sunshine, have been transmitted, as usual, to the Meteorological Office.

With the sanction of the Meteorological Council, data have been supplied to the Council of the Royal Meteorological Society, the Institute of Mining Engineers, and the editor of 'Symons' Monthly Meteorological Magazine.'

During the year there occurred the death of Mr. E. Dagwell, an assistant principally occupied in the Meteorological Department; his connection with the Observatory had lasted since 1881.

Electrograph.—As a result of experimental investigations made in the present and preceding year, several important changes have been made in the water-dropping apparatus. A new water reservoir and overflow tube have been obtained, and the jet has been brought much nearer the electrometer. The auxiliary battery having considerably deteriorated, it was sent to the makers on November 20, and the instrument in consequence remained out of action until the end of the year.

Determinations of the scale value were made on March 30, June 27, July 27, and October 24, by direct comparison with the Portable Electrometer, White No. 53.

Inspections.—In compliance with the request of the Meteorological Council, the following Observatories and Anemograph Stations have been visited and inspected:—Yarmouth, North Shields, Alnwick Castle, Fort William, Glasgow, Aberdeen, and Deerness (Orkney) by Mr. Baker; and Radcliffe Observatory (Oxford), Holyhead, Fleetwood, Stonyhurst, Armagh, Dublin, Valencia, and Falmouth by Mr. Constable.

III. SOLAR OBSERVATIONS.

Sun-spots.—Sketches of Sun-spots have been made on 161 days, and the groups numbered, after Schwabe's method.

Particulars will be found in Appendix II, Table IV.

IV. EXPERIMENTAL WORK.

Fog and Mist.—The observations of a series of distant objects, referred to in previous Reports, have been continued. A note is taken of the most distant of the selected objects which is visible at each observation hour.

Atmospheric Electricity.—The eye observations referred to in last year's Report have been discussed ('Roy. Soc. Proc.,' vol. 60, 1896, p. 96). Some further experiments have been carried out on

similar lines, and in particular comparisons have been made of the potential at the spot where the jet of the water-dropper breaks up with that at a station outside the immediate influence of the Observatory buildings.

Aneroid Barometers.—A large number of experiments have been made in continuation of those mentioned last year, and the readings have been reduced. Further experiments are contemplated. In the meantime the results are being worked up by the Superintendent.

Nocturnal Radiation.—The observations with minimum thermometers referred to last year have been continued.

Platinum Thermometers.—Observations have been made from time to time of the readings of six platinum thermometers in ice and steam, and of certain of the number in sulphur vapour and in molten silver, special attention being paid to changes of zero.

A series of comparisons of mercury and platinum thermometers at temperatures above 100° C. has been made, the thermometers being immersed in a well-stirred fusible metal bath, kindly lent by Mr. C. T. Heycock, F.R.S., and Mr. Neville. The comparisons were initiated by these gentlemen, who visited the Observatory during several days in January.

Early in the year a platinum resistance thermometer was buried underground along with two iron resistance thermometers of a type invented by Professor H. Callendar, F.R.S., and Mr. E. H. Griffiths, F.R.S. During the year readings of earth temperatures have been taken usually twice a day, and a report on the behaviour of the instruments has been submitted to the Meteorological Council, on whose behalf the experiments were undertaken.

Small inconsistencies in the behaviour of the resistance box used with the platinum thermometers having been brought to light, the Committee have arranged with Dr. Harker, late of Owens College, Manchester, to investigate the matter, so that the defect may be remedied.

Photographic Test for Lenses.—Difficulties having been repeatedly met with in applying the present tests for curvature, astignatism, and definition, experiments have been made which may lead to replacing or supplementing these tests by direct observations and measurements on a photographic plate.

V. VERIFICATION OF INSTRUMENTS.

The subjoined is a list of the instruments examined in the year 1896, with the corresponding results for 1895:—

		ested in the year December 31.
	1895.	1896.
Air-meters	5	5
Anemometers	7	12
Aneroids	254	113
Artificial horizons	15	21
Barometers, Marine	151	84
" Standard	64	72
,, Station	25	40
Binoculars	376	455
Compasses	244	3
Deflectors	20	authorizing.
Hydrometers	187	374
Inclinometers	4	8
Photographic Lenses	14	14
Magnets		4
Navy Telescopes		546
Rain Gauges		17
Rain Measuring Glasses		26
Scales		1
Sextants		591
Sunshine Recorders		2
Theodolites	. 7	5
Thermometers, Avitreous or Immisch's	s = 39	7
" Clinical	16,699	13,772
" Deep sea	125	74
" High Range		52
" Hypsometric		34
,, Low Range	. 114	62

" Solar radiation	. 3	2
" Standard	. 81	69
Unifilars	4	3
Vertical Force Instruments	. 34	0
Total	22,271	20,566

Duplicate copies of corrections have been supplied in 98 cases.

The number of instruments rejected in 1895 and 1896 on account of excessive error or for other reasons was as follows:—

	1895.	1896.
Thermometers, clinical	195	161
,, ordinary meteorological	48	56
Sextants	83	79
Telescopes	10	30
Various	38	43

Five Standard Thermometers have been supplied during the year.

There were at the end of the year in the Observatory undergoing verification 10 Barometers, 962 Thermometers, 22 Sextants, 30 Hydrometers, 2 Air Meters, and 1 Sunshine Recorder.

VI. RATING OF WATCHES AND CHRONOMETERS.

The high standard of excellence to which attention was drawn in last year's Report has been fully maintained, and there has been a marked increase in the number of watches which have obtained the highest possible form of certificate—the class A especially good—(involving the attainment of 80 per cent. of the total marks), no less than 96 being so classed.

The 583 watches received were entered for trial as below:—

For class A, 400; class B, 115; class C, 50; and 18 for the subsidiary trial. Of these 14 passed the subsidiary test, 118 failed from various causes to gain any certificate; 25 were awarded class C certificates, 111 class B, and 315 class A; of the latter, 96 obtained the highest form of certificate, class A, especially good.

In Appendix III will be found a table giving the results of trial of the 96 watches which gained the highest number of marks during the year. The first place was taken by Messrs. Stauffer, Son, & Co., London, with a keyless, going-barrel, chronometer-watch, No. 147,545, with the "Tourbillon" escapement, which obtained 89.4 marks out of a maximum of 100. The performance of the first 4 watches on the list, embracing 1 "Tourbillon" movement, 2 Bar-levers, and 1 "Karrusel," is very fine, and the marks obtained are unusually close.

Owing to considerations of space, it is intended to publish in future annual Reports particulars as to the first 50 watches only which come up to the standard of 80 marks and over. If a larger number should reach that standard, they will be mentioned in a full list which will be sent for publication to the horological journals.

It is intended shortly to suspend the class C test for watches.

Marine Chronometers.—During the year, 61 chronometers have been entered for the Kew A and B trials, of which 51 were certificated, and 10 failed to pass.

The new gas boiler for the watch oven has been very successful, and the difficulty of regularly maintaining the temperature at about 90° F. has been greatly reduced, and a considerably higher temperature could be easily obtained.

The improvements to the refrigerator mentioned in last year's Report have also proved of considerable advantage.

The mean time standard clock "French" has had new seconds contact pieces, &c., fitted to it by Dent & Co., and has been fixed in a new position in the South Hall, where the daily range of temperature is but small.

VII. MISCELLANEOUS.

Paper.—Prepared photographic paper has been supplied to the Observatories at Hong Kong, Lisbon, Mauritius, St. Petersburg, Toronto, Oxford (Radcliffe), and Stonyhurst, and through the Meteorological Office to Aberdeen, Batavia, Fort William, and Valencia.

Anemograph and Sunshine Sheets have also been sent to Hong Kong and Mauritius, and papier Saxe to Coimbra.

Exhibition at Glasgow.—A selection of photographic curves from the various self-recording instruments, along with photographs of clouds and of sun spots, was shown during the summer at an exhibition promoted by the Corporation of Glasgow. The exhibits have all been safely returned.

House, Grounds, and Paths.—These have been kept as usual throughout the year.

Dines' Pressure Tube Anemometer.—A self-recording tube anemometer belonging to the Meteorological Office was erected on the roof early in December. Its vanc is approximately at the same level as the cups of the standard "Robinson" Anemometer.

Ships' Compasses.—The test applied to ships' compasses has been revised and extended, with the kind assistance of Captain E. W. Creak, R.N., F.R.S., so as to bring it more into line with that approved by the Admiralty; and it is intended shortly to put the new regulations into operation. With a view to doing so, an apparatus has been obtained from Mr. A. W. Dover, similar to that employed at Deptford, for determining the accuracy of the compass bowl and card and the strength of the magnets.

Travellers' Azimuth Compasses.—Special experiments, approved by Mr. Francis Galton, Chairman of the Committee, have been applied to a variety of old and new compasses, submitted on behalf of the

Royal Geographical Society, to whom a report will shortly be submitted.

Library.—During the year the Committee lost the valuable services of Mr. R. S. Whipple, son of the late Superintendent, who had acted as Librarian and Accountant. The vacancy thus occasioned on the staff has been filled by the appointment of Mr. G. E. Bailey, previously employed in library and bursarial work at King's College, Cambridge.

The number of publications received during the year was much as usual. Volumes 14 to 36 of the 5th Series of the 'Philosophical Magazine' have been purchased to fill a gap.

Audit, &c.—The accounts for 1896 have been audited by Mr. W. B. Keen, Chartered Accountant, on behalf of the Royal Society, and by Mr. R. H. Scott on behalf of the Committee.

The present system of book-keeping having now been in operation for two years, the comparison of the expenditure of the present and previous years, suspended in 1895, has been resumed; it will be found on the opposite page.

The Committee found themselves in a position to purchase in November £400 India $3\frac{1}{2}$ per cent. Inscribed Stock.

PERSONAL ESTABLISHMENT.

The staff employed is as follows:—

- C. Chree, Sc.D., Superintendent.
- T. W. Baker, Chief Assistant.
- E. G. Constable, Observations and Rating.

W. Hugo, Verification Department.

- G. E. Bailey, Accounts and Library.
- E. Boxall, Observations and Rating, and six other Assistants.
- A Caretaker and Housekeeper are also employed.

(Signed) FRANCIS GALTON,

Chairman.

APPENDIX I.

MAGNETICAL OBSERVATIONS, 1896.

Made at the Kew Observatory, Old Deer Park, Richmond, Lat. 51° 28′ 6″ N. and Long. 0^h 1^m 15^s·1 W.

The results given in the following tables are deduced from the magnetograph curves which have been standardised by observations of deflection and vibration. These were made with the Collimator Magnet K.C. I. and the Declinometer Magnet marked K.O. 90 in the 9-inch Unifilar Magnetometer by Jones.

The Inclination was observed with the Inclinometer by Barrow, No. 33, and needles 1 and 2, which are $3\frac{1}{2}$ inches in length.

The Declination and Force values given in Tables I to VIII are prepared in accordance with the suggestions made in the fifth report of the Committee of the British Association on comparing and reducing Magnetic Observations.

The following is a list of the days during the year 1896 which were selected by the Astronomer Royal, as suitable for the determination of the magnetic diurnal inequalities, and which have been employed in the preparation of the magnetic tables:—

January	1,	2,	21,	24,	29.
February	7,	18,	20,	23,	24.
March	11,	16,	17,	18,	21.
April	7,	14,	16,	20,	30.
May	5,	6,	9,	26,	29.
June	2	7,	20,	23,	24.
July	2,	9,	17,	19,	31.
August	5,	13,	16,	27,	28.
September	8,	9,	10,	25,	28.
October	6,	7,	18,	25,	26.
November	3,	12,	22,	24,	25.
December	8,	12,	18.	19,	24.

^{*} The Inclination and Vertical Force are from eye observations at 2 p.m.
† Of the two values of the Inclination and Vertical Force, the first is based on observations with 3-inch dip needles only, the second on combined observations with needles of 3, 6, and 9 inches.

[‡] At new observatory, situated some little distance from old station. § New dip needles.
